The Rinaldi family's interest in expanded polystyrene began at the beginning of the 80s thanks to the experience gained by the current general manager Antonio Rinaldi in the horticultural field.

In fact, since the Piana del Sele is one of the largest agricultural areas in Italy, and since the demand for packaging is very strong, the will to place a plant for the production of EPS packaging for agriculture has grown more and more, in particular for horticulture.

Riba Sud srl then, over the years, has been able to establish a collaborative relationship with various nursery companies present in the area to give life to products that increasingly respond to the needs of the sector. This experience then made it possible to undertake new technical-commercial relationships with other companies present throughout the national territory and also in some countries of the area of the Mediterranean.

Entrepreneurial intuitions are not limited to the examples outlined so far. In fact, the group can boast an excellent application of ducts for soilless flower production: that is, entire plants in EPS which allow, for example, a consumption of limited water, more comfortable and less strenuous work positions and the exploitation of exhausted soils.

Expanded polystyrene thanks to its technical characteristics such as impact resistance, non-toxicity, and above all being devoid of nutritional values, cannot rot or mold or generate fungi, bacteria or other microorganisms that can damage crops.
